MA028 v2.4
CopyRight® v2.0 BAC Cloning Kits

Technical Support

Lucigen is dedicated to the success and satisfaction of our customers. Our products are tested to ensure that they perform as specified when used according to our recommendations. It is imperative that the reagents supplied by the user, especially the DNA targets to be cloned, are of the highest quality. Please follow the manual carefully and contact our technical service representatives if additional information is necessary. We encourage you to contact us with your comments regarding the performance of our products in your applications. Thank you.

Notice of Limited Label License, Copyright, Patents, Warranties, Disclaimers and Trademarks

* The use of the CopyRight Cloning Kits is covered under U.S. Patent No. 5,874,259 and other patents pending. This product is sold under license from the University of Wisconsin-Madison. Its use is limited solely to research purposes.

Copyright © 2001-2007 by Lucigen Corp. All rights reserved. UltraClone, CloneDirect, pEZ, pEZSeq, cSMART, and Replicator are trademarks of Lucigen Corp. Lucigen, CopyRight, CloneSmart, ClonePlex, DNATerminator, E. cloni, EconoTaq, PCRTerminator, BigEasy, pJAZZ, and pSMART are registered trademarks of Lucigen Corp. HydroShear and GeneMachines are registered trademarks of GeneMachines Corporation (San Carlos, CA).

Lucigen’s products are sold for research use only and are not to be used in humans or for medical diagnostics. Lucigen’s liability with respect to any CloneSmart product is limited to the replacement of the product. No other warranties of any kind, expressed or implied, including without limitation, any implied fitness for any particular use, are provided by Lucigen. Lucigen is not liable for any direct, indirect, incidental or consequential damages arising out of or in connection with the use or inability to use any of its CloneSmart products.

Limited Label License

This product is the subject of U.S. Patent #6,709,861 and pending patent applications owned by Lucigen Corporation. The consideration paid for this product grants a Limited License to use the product pursuant to the terms set forth in this Limited Label License. Academic, Not-for-Profit and For-Profit institutions acquire certain limited nontransferable rights with the purchase of this product (see below).

The purchase price of this product includes limited, nontransferable rights to use only the purchased amount of the product to perform CloneSmart Blunt Cloning Technology and only as described in CloneSmart Blunt Cloning Kit Instruction Manual. This limited license specifically excludes manufacture of the pSMART vector or derivatives thereof. Lucigen Corporation reserves all other rights; in particular, the purchaser of this product may not transfer or otherwise sell this product or its components or derivatives to a third party, and no rights are conveyed to the purchaser to use the product or its components or derivatives for commercial purposes. “Commercial purposes” includes any activity for which a party receives consideration and may include, but is not limited to, (1) use of the product or its components or derivatives in manufacturing, (2) use of the product or its components or derivatives for diagnostic purposes, (3) transfer or sale of vectors made with the product or components or derivatives of the product, (4) use of this product or materials made therefrom to provide a service, information, or data (e.g., DNA sequence) to a third party in return for a fee or other consideration, or (5) resale of the product or its components or derivatives, whether or not such product or its components or derivatives are resold for use in research. Academic, Not-for-Profit, and For-Profit institutions must obtain a separate license from Lucigen Corporation to use this product for any purpose other than those permitted above. It is the sole responsibility of the buyer to ensure that use of the product does not infringe that patent rights of third parties.

If the purchaser is not willing to accept these use limitations, Lucigen Corporation is willing to accept return of the product for a full refund. For information on obtaining a license, contact Lucigen Corporation, 2120 W. Greenview Dr., Middleton, WI 53562. Email: Lucigen@lucigen.com. Phone: 608-831-9011. Fax 608-831-9012.

**CopyRight® v2.0 BAC Cloning Kits**

**Kit Description**

Bacterial artificial chromosomes (BACs) are important tools for positional cloning, physical mapping, and genomic sequencing of large DNAs. BAC vectors can maintain inserts of up to 350 kb, utilizing the single-copy origin of the *E. coli* F plasmid. In addition, these vectors are extremely useful for cloning smaller unstable and recalcitrant DNAs (10-20 kb), which appear to be more stable at lower copy number.

Lucigen’s CopyRight v2.0 BAC Cloning System introduces the ultimate in BAC vector design. Most single-copy vectors yield small amounts of DNA and are prone to transcription error and instability. The unique design of Lucigen’s CopyRight vectors reduces or eliminates transcription both into and out of the insert DNA, reducing the cloning bias commonly found with standard plasmids. Lucigen’s CopyRight vectors also completely eliminate uncut vector background without the risk of clone loss. CopyRight kits further feature “on command” amplification of vector and copy number, increasing yield to as many as 50 copies per cell. The combination of inducible copy number amplification and Lucigen’s patented transcription-free cloning technology provides maximum stability of otherwise unclonable sequences. When used with Lucigen’s BAC-Optimized Replicator v2.0 Electrocompetent Cells, hundreds or thousands of recombinant clones can be routinely obtained per transformation.

CopyRight amplification permits easy isolation of plasmid DNA for sequencing, shotgun subcloning, or restriction mapping. Lucigen’s pSMART® or pEZ™ BAC vector is pre-cut and dephosphorylated, eliminating the need for vector preparation. CopyRight kits contain the pSMART or pEZ BAC cloning vector, buffer, ligase, sequencing primers, induction solution, and control DNA, as well as BAC-Optimized Replicator v2.0 Electrocompetent Cells.

The CopyRight vectors, together with the BAC-Optimized Replicator v2.0 Electrocompetent Cells, incorporate controllable genetic elements that allow the single copy BAC to be amplified *in vivo*. The single-copy state is controlled by the ori2 (oriS) origin of replication, repE gene, and parABC partition loci, all of which are located on the vector backbone. The CopyRight vectors also carry the oriV medium-copy origin of replication, which is active only in the presence of the TrfA replication protein. The gene for TrfA is incorporated into the genome of BAC-Optimized Replicator v2.0 Cells under control of the *araC-P*BAD promoter (Wild *et al.*, 2002). Addition of L-arabinose induces expression of TrfA, which activates oriV, causing the plasmid to replicate to up to 50 copies per cell (Figure 1).

---

**Figure 1. BAC-Optimized Replicator v2.0 Cell with the CopyRight vector.** Addition of L-arabinose results in amplification of the vector copy number.

MA028 v2.4
CopyRight® v2.0 BAC Cloning Kits

pSMART and pEZ BAC Vectors

The CopyRight pSMART BAC cloning vector incorporates transcription-free cloning for the highest stability possible. The vector is supplied pre-cut at BamHI, EcoRI or HindIII sites, with dephosphorylated ends. The pEZ BAC vector is supplied pre-cut at BamHI or HpaI sites, with dephosphorylated ends. Insert DNAs with 5'-phosphorylated ends are ligated to the CopyRight vector and transformed into Lucigen’s BAC-Optimized Replicator v2.0 Electrocompetent Cells.

The pSMART® BAC vector has a lacZ/sacB stuffer region, allowing uncut vector to be detected by blue/white screening and selected against by plating on sucrose (Figure 2). This feature completely eliminates the background of uncut vector, improving the efficiency of colony picking. However, unlike other cloning vectors, the promoter as well as the coding sequence of the stuffer fragment is completely removed during processing. This design prevents active expression of the insert DNA by the lacZ or sacB promoter, contributing greatly to plasmid stability, especially for inserts containing toxic coding sequences, strong secondary structure, or other deleterious features.

On the other hand, the pEZ BAC vector retains the lacZ indicator gene to allow blue-white screening of BAC colonies.

In addition, the CopyRight vectors have the chloramphenicol promoter facing away from the cloning site, protecting inserts from the destabilizing influence of transcription. In conventional BAC vectors, transcription from the chloramphenicol promoter is oriented toward the insert cloning site.

Transcription from cloned promoters is another source of clone gaps in libraries made in conventional plasmids. Cloned promoters can express the lacZ or sacB genes in the conventional vectors, leading to selection against true recombinant plasmids. Transcription from the insert into the vector can also interfere with plasmid replication or expression of drug resistance, contributing to difficulty in cloning and to library bias. The CopyRight vectors contain CloneSmart® terminators on either side of the cloning site to prevent this interference.

![Figure 2. Vectors pSMART and pEZ BAC. ori2, repE, IncC - origin of replication (single copy); oriV - inducible origin of replication; par A,B,C- partition genes; Cm - chloramphenicol resistance gene; cosN - lambda packaging signal; T – CloneSmart transcription terminators; sacB, sucrase gene; lacZ, alpha peptide portion of the beta galactosidase gene. Approximate positions of sequencing primers and transcription terminators are indicated.](image-url)
CopyRight® v2.0 BAC Cloning Kits

The CopyRight vectors contain the following features:

- Single-copy replication origin and inducible medium-copy replication origin
- Transcription terminators to stabilize recombinant clones
- Transcription/translation-free cloning for unstable DNAs
- lacZ/sacB stuffer that is completely removed for minimal background and no bias (pSMART BAC vector only)
- Bacteriophage lambda cos site for lambda packaging or terminase cleavage
- loxP site for Cre-recombinase recognition
- Rare-cutting restriction sites on either side of insert
- Chloramphenicol resistance gene

BAC-Optimized Replicator v2.0 Electrocompetent Cells

Lucigen's BAC-Optimized Replicator v2.0 Electrocompetent Cells are genotypically similar to E. coli strain DH10B, but they contain an inducible trfA gene, which provides an optional amplification of the CopyRight clones to higher copy number (20-50 copies per cell). Common lab strains of E. coli do not contain a trfA gene and thus will not support copy number amplification of the CopyRight vectors.

BAC-Optimized Replicator v2.0 Electrocompetent Cells provide the highest transformation efficiency of BAC-sized DNA by electroporation. These cells yield \( \geq 5 \times 10^7 \) cfu/\( \mu \)g of 200-kb supercoiled BAC DNA. Thus they are ideal for cloning and propagation of BAC clones. They also contain the inactive mcr and mrr mutations, allowing methylated genomic DNA to be cloned without deletions or rearrangements. They do not contain the F plasmid. The BAC-Optimized Replicator v2.0 cells contain the endA1 and recA1 mutations for high yield and high quality plasmid DNA.

**BAC-Optimized Replicator v2.0 Genotype:** F<sup>−</sup> mcrA Δ(mrr-hsdRMS-mcrBC) φ80lacZΔM15 ΔlacX74 endA1 recA1 araD139 Δ(ara,leu)7697 galU galK rpsL nupG (attL araC-P<sub>BAD</sub>-trfA250 bla attR) λ<sup>−</sup>

The plasmid pKanR (Kanamycin resistant) is provided as a control for transformation of BAC-Optimized Replicator v2.0 Cells.

Construction of BAC Libraries

Lucigen has optimized the preparation and design of the CopyRight vectors. The quality of results obtained is directly related to the quality of the input DNA preparation. The following points are critical for cloning all inserts, especially large inserts, into CopyRight vectors.

**1. Do not pipette HMW DNA with standard pipette tips.** High molecular weight DNA is readily sheared by pipeting. The use of wide bore pipette tips will minimize unwanted shearing. Purification and fragmentation of very high molecular weight DNA can be accomplished using a number of different methods. References 2-5 provide details for preparing DNA for BAC and fosmid cloning.

**2. Do not expose DNA to UV light!** DNA resolved on agarose gels is generally stained with ethidium bromide and visualized by illumination with ultraviolet light. Exposure to short wavelength ultraviolet light (e.g., 254, 302, or 312 nm) can reduce cloning efficiency by several orders of magnitude in a few seconds (Figure 3).
CopyRight® v2.0 BAC Cloning Kits

Figure 3. Relative cloning efficiency of pUC19 after exposure to short or long wavelength UV light. Intact pUC19 DNA was transformed after no UV exposure (“No UV”) or exposure to 302 nm UV light for 30, 60, or 90 seconds (“30s 302nm, 60s 302nm, 120s 302nm”). Cloning efficiencies were calculated relative to un-irradiated pUC19 DNA.

Note that the wavelength of most UV transilluminators, even those designated specifically for DNA visualization, is typically 302 nm or 312 nm, and can cause significant damage to DNA. See Reference 1 for methods to isolate DNA from gels without exposing DNA to UV.

3. BAC-Optimized Replicator v2.0 Cells are required for copy number amplification. Induction of the CopyRight vectors from single copy to high copy number requires the use of BAC-Optimized Replicator v2.0 Cells, which carry the trfA gene. Amplification will not occur in standard laboratory strains of E. coli.

For construction of a BAC library, there are several important steps, listed below:

1. Purify high molecular weight (HMW) genomic DNA.
2. Partially digest or randomly shear DNA to desired size.
3. Size select DNA by PFGE.
4. Test ligations of genomic and vector DNA.
5. Electroporate into E. coli.
6. Plate on selective media.
7. Pick transformants.
8. Assay for insert size and background.
9. Repeat until acceptable and scale up.

Protocols specific to the ligation and transformation of large insert BAC libraries constructed in the CopyRight vectors are provided below. Detailed protocols for manipulating HMW DNA, BAC cloning, and handling BAC recombinant clones can be found in references 1, 5-8, 11, and 12.

Materials and Equipment Needed

The CopyRight v2.0 BAC Cloning Kits supply many of the items needed to efficiently generate recombinant clones. While simple and convenient, successful use of the CopyRight Kit requires proper planning for each step. Please read the entire manual and prepare the necessary equipment and materials before starting. Following ligation, the following items are required for transformation:

- Electroporation apparatus and cuvettes. For optimal BAC transformation, we recommend the Whatman Biometra Cell-Porator® electroporation system (Cat.#11609013) and Voltage booster (Cat.
BAC Cloning Protocol

Partial Digestion of High Molecular Weight (HMW) genomic DNA

A BAC library construction typically requires ~10-30 μg of HMW genomic DNA, embedded in five–ten plugs of Low Melting Temperature (LMT) agarose. The following protocol describes digestion of the embedded DNA with restriction enzymes. Each restriction enzyme must be titrated to determine the optimal amount for partial digestion. Typical digests use 0.2-10 units of enzyme per 1-10 μg of DNA. We strongly recommend using enzymes compatible with BamHI, EcoRI, or HindIII for digestion of insert DNA. Construction of BAC libraries with blunt inserts is not recommended.

1. Cut each 100-μl plug of HMW DNA into 9 slices with a glass cover slip. Use 3 slices for each digestion reaction.

2. Prepare a master mix of enzyme incubation buffer in a 15 ml Falcon tube.

   **Pre-Incubation Buffer (10 digestion reactions)**

<table>
<thead>
<tr>
<th>Component</th>
<th>Volume (μl)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H₂O</td>
<td>8670</td>
</tr>
<tr>
<td>10 x enzyme buffer</td>
<td>1000</td>

<tr>
<td>1 M spermidine</td>
<td>20</td>
</tr>
<tr>
<td>1 M DTT</td>
<td>10</td>
</tr>
<tr>
<td>Total</td>
<td>9700</td>
</tr>
</tbody>
</table>

3. Transfer the desired number of gel slices into a plastic weigh boat. Add 970 μl of Pre-Incubation Buffer per 3 plug slices. Place on ice for 30 minutes. Discard the buffer and repeat once.

4. Prepare Digestion Buffer as follows:

   **1X Digestion Buffer (10 digestion reactions)**

<table>
<thead>
<tr>
<th>Component</th>
<th>Volume (μl)</th>
</tr>
</thead>
<tbody>
<tr>
<td>H₂O</td>
<td>1324.9</td>
</tr>
<tr>
<td>10 x enzyme buffer*</td>
<td>170</td>
</tr>
<tr>
<td>1 M spermidine</td>

</tr>
<tr>
<td>1 M DTT</td>
<td>1.7</td>
</tr>
<tr>
<td>10 mg/ml BSA</td>
<td>100</td>
</tr>
<tr>
<td>Total</td>
<td>1600</td>
</tr>
</tbody>
</table>

   *Manufacture’s recommended buffer

5. To each 1.5 ml tube containing 3 gel plug slices, add 160 μl of the prepared 1X Digestion Buffer. Then add 1-10 μl of restriction enzyme (0.2 to 20 Units total) and water to bring the final volume of digestion mixture.
to 170 μl. **Note:** If necessary, dilute the enzyme in 1x Digestion Buffer before adding to the reaction mixture.

6. Incubate the plug slices on ice for 60 minutes to allow the enzyme to diffuse into the plugs. Transfer the tubes to 37°C, and digest for 10 minutes.

7. Stop the reaction by immediately transferring the tubes on ice and adding 1/10 volume of 0.5 M EDTA, pH 8.0.

8. Analyze the partial digestion by pulsed-field gel electrophoresis under the following conditions:

   1% agarose in 0.5 x TBE, 12.5°C (cooler settings), 80 (pump settings), 120° angle, 6 V/cm, initial pulse time of 50 seconds and final pulse time of 50 seconds for 18 - 24 hours.

9. Stain and photograph the gel. Determine the concentration of the enzyme that produces the highest proportion of fragments in the size range of 100 - 350 kb (Figure 4).

10. Use the selected concentration of enzyme for large-scale partial digestion for BAC cloning.

![Figure 4. Partial digestion of HMW genomic DNA.](image)

Mouse genomic DNA was partially digested with EcoRI. Lanes 1-9 show results with various amounts of EcoRI (0, 0.2, 0.4, 0.6, 0.8, 1.2, 1.6, 2.0, 2.4 units). The amount of EcoRI that produced optimal fragmentation of 100-350 kb was 0.6-1.2 units. Lane M, DNA size marker (Lambda ladder).

**Size Selection of the partially digested HMW DNA**

Size select the partially digested DNA by agarose gel electrophoresis. Ideally, use Pulse Field Gel Electrophoresis (e.g., CHEF, FIGE, etc.) with voltage and ramp times recommended by the manufacturer for separation of 10-500 kb DNA. For example, 1% agarose CHEF gel, 0.5X TBE, 6V/cm, 50s, 50s, 18hrs, 120° angle,12°C. If a PFGE apparatus is not available, run the sample overnight on a 20-cm, 1% agarose gel at 30-35 V. Minigels (e.g., 10 cm) do not provide sufficient resolution of DNA in the 10-500 kb size range.

1. Prepare a 1% agarose gel in 0.5X TBE buffer. **Note:** Do not include ethidium bromide in the gel or buffer.

2. Load DNA marker (e.g., MidRange I PFG Marker [New England BioLabs, catalog no. N3551S]) into each of the outside lanes of the gel. Load the digested DNA in a trough between the DNA markers.
CopyRight® v2.0 BAC Cloning Kits

3. Resolve the samples by gel electrophoresis as described above. Following electrophoresis, cut off the outer lanes of the gel containing the DNA size marker. Stain the DNA marker lanes with ethidium bromide and visualize the DNA with UV light. Mark the 100-kb and 350-kb positions of the DNA marker in the gel using a razor blade. **Do not expose the bulk of sample DNA to UV irradiation!** Even short UV exposure can decrease cloning efficiencies by 100-1000 fold. Reassemble the gel and excise a 3-5 mm wide gel slice containing sample DNA that migrated between 100 and 350 kb. Transfer the gel slice to a sterile, 15-ml Falcon tube.

4. Proceed with Recovery of the Size-Fractionated DNA in the next step or store the gel slice at 4°C for up to one year.

**Recovery of the Size-Fractionated DNA by Electroelution and Dialysis**

Electroelute the DNA in each gel section into a dialysis tube (Spectrum, cutoff = 12~14 kD, catalog no. 132676) as follows:

1. Cut a piece of dialysis tube to 5 - 10 cm (~5 cm longer the gel section to be electroeluted). Rinse several times with ice-cold ddH₂O and then with ice-cold 0.5X TBE.

   Place the gel section into the tube, close one end of the tube with a membrane tubing closure, fill the tube with ice-cold 0.5X TBE to completely submerge the gel slice in buffer (usually 100 - 300 µl). Remove all bubbles in the tube, and close the other end of the tube.

   Submerge the dialysis tube in 0.5X TBE in the CHEF chamber and electroelute the DNA in the gel section by PFGE under the following conditions: 12°C (cooler settings), 80 (pump settings), 120° angle, 6 V/cm, initial pulse time 30 seconds and final pulse time 30 seconds for 4 hrs.

   After four hours, turn the dialysis tube 180° and continue to run the tube for exactly one minute to run the eluted DNA off the dialysis tube wall.

   If a PFGE apparatus is not available, run the electroelution sample at 30-35 V overnight.

2. Transfer the dialysis tube to ice-cold 0.5X TE for 1 hour. Repeat at least 2 more times. Carefully collect the DNA in the dialysis tube with a cut-off pipet tip into a 1.5 ml microfuge tube.

3. Determine the DNA concentration by fluorimetry. Alternately, estimate the concentration of the DNA by running an aliquot of the DNA on an agarose gel using dilutions of known amounts of the Lambda Control DNA as standard. Note: Measuring the DNA concentration by spectrophotometry (OD\/260) is not recommended because the DNA concentration will not be high enough to be measured accurately. This DNA can be directly used for ligation.

**Ligation of the Size-Fractionated DNA with the BAC Cloning Vector**

The volume of a BAC library ligation reaction varies from 50 to 500 µl. For a 50 µl reaction, add 25 ng of vector and 100 ng of insert DNA with an average size of 100-200 kb. Set up trial ligations with varying amounts of vector to optimize the vector:insert ratio.

Also, perform a ligation control using 80 ng of the Positive Control Insert DNA in a parallel reaction.

The ligation is performed as follows:

1. Combine the following components in a 1.5-ml tube, using a large bore pipette tip.

   \[ x \mu l \text{ Insert DNA (HpaI [blunt], BamHI, EcoRI, or HindIII compatible ends, 100 ng)} \\
   y \mu l \text{ H}_2\text{O} \\
   10.0 \mu l \text{ CopyRight® 5X Ligation Buffer} \\
   1.0 \mu l \text{ pSMART BAC Vector (25 ng/µl)} \\
   48.0 \mu l \]

---

Lucigen® Corporation

(608) 831-9011
www.lucigen.com
CopyRight® v2.0 BAC Cloning Kits

2. Add 2 µl CopyRight DNA Ligase, and mix by slowly stirring contents. Incubate at 16 °C overnight for BACs or for 4 hours for smaller DNA fragments.

3. The sample is ready for transformation; heat-denaturation and desalting the DNA are not necessary and are not recommended. The sample may be concentrated if desired.

Transformation of BAC-Optimized Replicator™ v2.0 Electrocompetent Cells

Electroporation conditions and protocols

BAC cloning applications demand the highest transformation efficiency and recovery of the largest clones possible. To ensure optimal cloning results, we strongly recommend the use of Lucigen’s BAC-Optimized Replicator v2.0 Electrocompetent Cells. These cells are provided in 50-µl aliquots, sufficient for two transformation reactions. We also recommend use of the Cell Porator and Voltage Booster System by Whatman Biometra. Optimal settings for electroporation are listed below:

<table>
<thead>
<tr>
<th>Optimal Setting</th>

Whatman Biometra: Cell Porator and Voltage Booster System

Eppendorf: Model 2510;
Bio-Rad: Gene Pulser II #165-2105;
BTX: ECM630

1.5 mm Cuvettes: Whatman Biometra Cat.#11608031

1 mm Cuvettes: Eppendorf Model 4307-000-569, BTX Model 610, or BioRad Cat. #165-2089.
Users have reported difficulties using Lucigen cells with Invitrogen cuvettes Cat. # 65-0030.

The following protocols are specific for transformation of BAC-Optimized Replicator v2.0 Electrocompetent Cells. These cells with the above conditions yield ≥5 X 10^7 cfu/µg of 200 kb BAC DNA.

1. Make YT Agar from powder supplied with the cells in the kit.
2. Have room-temperature Recovery Medium (supplied with the Kit) and 17 x 100 mm sterile culture tubes readily available (one tube for each transformation reaction). Transformation efficiency may decrease substantially with SOC or other media.
3. Place electroporation cuvettes and microcentrifuge tubes on wet ice (one cuvette and one tube for each transformation reaction).
4. Remove BAC-Optimized Replicator v2.0 Cells from the -80°C freezer and thaw on wet ice (10-20 minutes).
5. Add 20 µl of cells to the chilled microcentrifuge tube.
6. Add 1 μl of the CopyRight ligation reaction to the 20 μl of cells on ice. Stir briefly with a pipet tip; do not pipette up and down, which can shear the DNA, introduce air bubbles, and warm the cells.

7. Carefully pipette 20 μl of the cell/DNA mixture into a chilled electroporation cuvette without introducing bubbles. Electroporate according to the conditions described above.

8. Transfer the cells immediately into a culture tube containing 1000 μl of Recovery Medium, and shake gently to resuspend the cells.

9. Place the tube in a shaking incubator at 225-250 rpm for 1 hour at 37°C.

10. Spread the following amounts of experimental reactions on YT+chl+5% sucrose plates (+XGAL/IPTG if desired). Plate the pAKL control on a YT+kanamycin plate. Incubate the plates overnight at 37°C.

Expected Results

The results presented below are expected when cloning 100 ng of intact, purified DNA fragments, with 5’ phosphate groups and the appropriate cohesive ends, into Lucigen’s BAC-Optimized Replicator™ v2.0 Electrocompetent Cells.

The number of recombinant clones is typically 100-fold greater than the background of self-ligated CopyRight vector. The background number of empty CopyRight vector is constant (<10 colonies per 100 μl of cells plated), unless kinase, nuclease, or other contaminants are introduced. However, use of too little insert DNA, insert DNA with improper ends, or modified DNA, yields significantly lower recombinant cloning efficiencies. With fewer recombinant clones, the fraction of empty vector colonies becomes relatively higher. For example, if the Experimental Insert ligation reaction produces only 25 colonies from 100 μl of cells plated, then the 10 colonies obtained from 100 μl of the No-Insert Control ligation will represent a background of 40%.

Use of competent cells with a transformation efficiency of less than 1 x 10^10 cfu/μg will severely compromise the desired results, yielding less than 5% the number of CFUs listed below.

</tbody>
</table>

1. Using Lucigen’s BAC-Optimized Replicator v2.0 Electrocompetent Cells, a CopyRight ligation reaction with 80 ng of positive control insert DNA is expected to yield >200 colonies from a 100 μl aliquot of transformed cells, with >95% inserts. Results with experimental DNA may vary significantly, particularly with larger insert sizes, skewed base composition, encoded peptides, etc.

2. A 100-μl aliquot of the empty vector control reaction should produce <10 colonies, representing less than 1% background.

3. A 2-μl aliquot of transformed cells from the supercoiled pAKL reaction (diluted into 90 μl of TB) should yield >200 colonies, or 2 x 10^10 colonies per μg plasmid.

DNA Isolation & Sequencing

Transformants are grown in LB or TB medium plus 12.5 μg/ml chloramphenicol overnight with shaking at 37°C. DNA minipreps can be performed by standard methods.

Copy number amplification of BAC clones requires BAC-Optimized Replicator™ v2.0 Electrocompetent Cells and Arabinose Induction Solution. Transformants are grown in LB or TB medium plus 12.5 μg/ml chloramphenicol. Stable inserts of 10-40 kb can be grown overnight with shaking at 37°C in the presence of 1X Arabinose Induction Solution (provided in the Kit). DNA minipreps can be performed by standard methods.

For unstable BACs, first grow the cultures without induction to an OD_{600} of 0.2-0.3. To reach this OD, grow the cultures overnight at 37°C without shaking. The following morning, dilute the cultures 2-10 fold, and grow at 37°C with shaking at 225 rpm for 30 minutes. For each ml of culture, add 1 μl of 1000X Arabinose Induction Solution. Continue growth for 2-3 hours at 37°C with shaking at 225 rpm. Prepare DNA minipreps according to standard protocols.

BAC-Optimized Replicator v2.0 Electrocompetent cells are recA endA deficient and will provide high quality plasmid DNA. The CopyRight Kits are provided with the sequencing primers shown in Appendix D.

References

Appendix A: Media Recipes

YT + CXI + Sucrose Agar Medium.

Add the YT Agar powder provided with the kit to 500 ml of deionized water. Autoclave and cool to 55°C. Add the appropriate filter-sterilized antibiotic to the cooled medium (6.25 mg of chloramphenicol per 500 ml or 12.5 μg/ml). Also add to a final concentration: X-Gal to 40 μg/ml, IPTG to 0.4 mM. To screen against uncut pSMART BAC vector, add sucrose to 5% (w/v). The pEZ BAC vector does not allow for sucrose selection.

Temperatures of >55°C may destroy the antibiotics. Do NOT add antibiotics to hot media!

Pour approximately 20-25 ml per petri plate.

YT Agar is per liter: 8 g Bacto-tryptone, 5 g yeast extract, 5 g NaCl, 15 g agar. More YT Agar may be purchased separately as a 5-pack with catalog number 60025-1.

Note: Use of LB agar medium will result in small, slow-growing colonies.

TB Culture Medium. Per liter: 11.8 g Bacto-tryptone, 23.6 g yeast extract, 9.4 g dipotassium hydrogen phosphate (K₂HPO₄; anhydrous), 2.2 g potassium dihydrogen phosphate (KH₂PO₄; anhydrous), 0.4% glycerol. Mix all components except glycerol; autoclave and cool to 55°C. Before use, add 8 ml filter-sterilized 50% glycerol and add chloramphenicol to 12.5 μg/ml. Transformed cultures can be stored by adding sterile glycerol to 20% (final concentration) and freezing at -70°C. Unused portions of the ligation reactions may be stored at -20°C.

Appendix B: CopyRight Application Guide

The various CopyRight Cloning Kits are designed primarily for BAC library construction and for cloning very unstable fragments. Alternately, for cloning fragments of 30 kb or less, Lucigen's BigEasy® v2.0 Linear Cloning Kit provides the highest level of plasmid stability.

The BAC-Optimized Replicator™ v2.0 strain contains the inactive mcr and mrr alleles, which allows cloning of inserts that may be methylated, such as genomic DNA isolated directly from plant or mammalian cells.

Appendix C: Abbreviated BAC Cloning Protocol

1. Briefly centrifuge and gently mix the CopyRight Vector.
2. Combine the following components in a 1.5-ml tube. Add ligase last.

**BAC Ligation Reaction**

\[ x \mu l \text{ Insert DNA (} \text{BamHI, } \text{EcoRI or } \text{HindIII compatible ends, } 100 \text{ ng)} \]
\[ y \mu l \text{ } H_2O \]
\[ 10.0 \mu l \text{ CopyRight 5X Ligation buffer} \]
\[ 1.0 \mu l \text{ pSMART®-BAC or pEZ BAC vector (} \text{BamHI, } \text{EcoRI or } \text{HindIII digested, } 25 \text{ ng/µl)} \]

48.0 µl total reaction volume

Add 2 µl CopyRight DNA Ligase (1U/µl), and mix by slowly stirring contents.

3. Incubate overnight at 16 °C and use DIRECTLY for transformation (no purification or heat denaturation).
4. Cool the reactions and spin 1 minute at 12,000 rpm.

**BAC Transformation**

2. Chill electroporation cuvettes and 1.5 ml microfuge tubes on ice.
3. Thaw the BAC-Optimized Replicator v2.0 Electrocompetent Cells on wet ice. Pipet 20 µl of cells into a pre-chilled 1.5 ml tube on ice. Add 1µl ligation mixture.
4. Pipet the cell/DNA mixture to a chilled electroporation cuvette.
5. Electroporate. Immediately transfer the cell/DNA mixture to 500-1000 µl of Recovery Medium at room temperature.
6. Shake at 225 rpm for 60 minutes at 37°C.
7. Spread 100 µl per plate on YT agar plates containing chloramphenicol/ X-Gal/ IPTG/sucrose. Incubate overnight at 37°C.

**Colony Growth**

1. Pick colonies and grow in LB or TB medium containing 12.5 µg/ml chloramphenicol.
2. Add Arabinose Induction Solution to cultures when OD<sub>600</sub> reaches 0.2-0.3.
3. Grow 3 hours at 37°C with vigorous shaking.
Appendix D: Vector Maps and Sequencing Primers

The CopyRight vectors are supplied predigested with dephosphorylated ends. Transcription terminators border the cloning site to prevent transcription from the insert into the vector. Another terminator at the 3' end of the ampicillin or kanamycin resistance gene prevents this transcript from reading into the insert DNA. The sequences of the pSMART BAC primers are as follows:

**SL1**: 5’–CAG TCC AGT TAC GCT GGA GTC–3’
**SR4**: 5’–TTG ACC ATG TTG GTA TGA TTT–3’

The GenBank accession number for the pSMART BAC v2.0 vector is EU101022.
